

College Notice Board Application (Flutter with Hive)

Student Details

Name: Dhruv Ghori

Enrollment Number: 20230905050509

Course: B.Tech CSE

Subject: Flutter Development

1. Introduction

The College Notice Board Application is a simple Flutter mobile application developed to demonstrate local data storage in mobile apps. The application allows users to add, view, and manage college notices using a local database.

In this project, the Hive database is used to store notice information locally on the device. The application helps students and administrators publish important announcements such as exam schedules, holiday notices, and college events. The primary purpose of this project is to understand how Flutter applications can store and manage data locally without using an internet connection or external servers.

2. Objectives

- To understand the basics of Flutter application development
 - To implement local data storage using Hive database
 - To demonstrate CRUD operations (Create, Read, Update)
 - To develop a simple application for managing college notices
-

3. Technologies Used

Flutter – Framework used to build the mobile application

Dart – Programming language used in Flutter

Hive – Lightweight local database used for storing notice data

GitHub – Used for version control and project hosting

4. System Features

Add Notice

Users can add notice details such as notice title, description, and date.

View Notices

All published notices are displayed in a list format.

Update Notice

Users can modify or update existing notice records.

Local Storage

All notice data is stored locally on the device using Hive database.

5. System Workflow

Step 1

The user opens the College Notice Board application.

Step 2

The user selects the option to add a new notice.

Step 3

The user enters notice details such as title, description, and date.

Step 4

The notice data is stored locally in the Hive database.

Step 5

The user can view the list of published notices.

Step 6

If required, the user can update the notice details.

Step 7

The updated notice information is saved again in the database.

6. Application Architecture

The application consists of the following components:

Main Application File (main.dart)

This file initializes the Hive database and starts the Flutter application.

Screens

Home Screen – Allows navigation to add notices or view notices

Add Notice Screen – Allows users to publish a new notice

Notice List Screen – Displays the list of stored notices

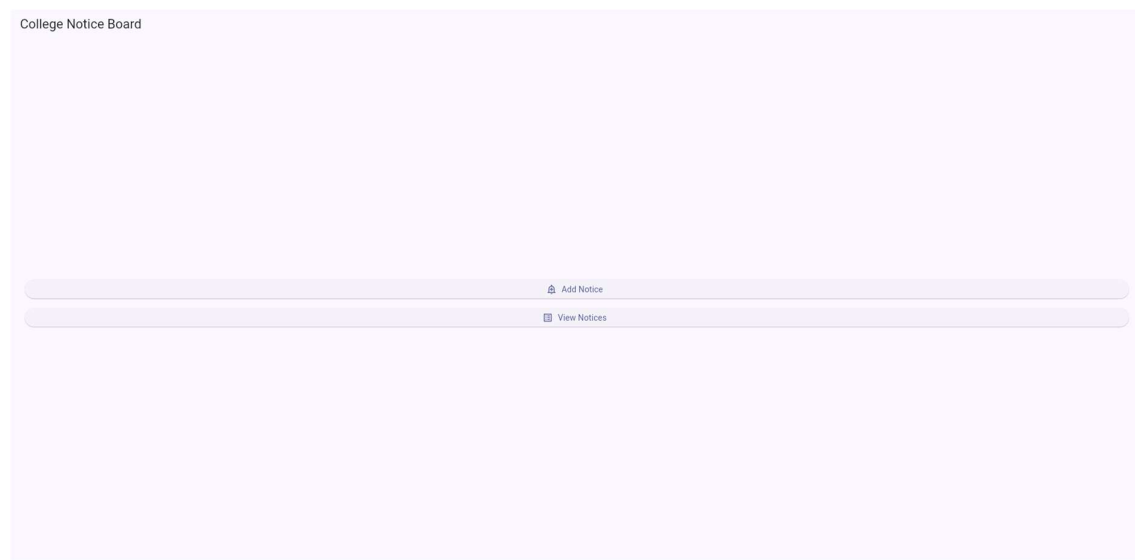

Database

Hive database is used to store and retrieve notice records locally.

7. Conclusion

The College Notice Board Application demonstrates how Flutter applications can manage and store notice information locally using the Hive database. The application allows users to add, view, and update notices. This project helps in understanding the implementation of local databases in Flutter applications and the use of GitHub for project management and code sharing.
